SAMPLE CODE

Configuring REST services in ColdFusion – Sample Code – POST Requests

(A)

SAMPLE CODE – POST – Script Based 01

We will run this example through Postman instead of a web browser. Normally, you would have a JSON payload with information when calling a POST method. However, to keep things simple we have omitted this from this scenario.

Make sure when calling the endpoint, you select POST in Postman and provide the correct URL. In the example below, it executed successfully and returned the success message we coded in the sample method.

```
//POST Request to write a new customer to the database
function post () access="remote" returntype="string" produces="application/json" httpmethod="POST" {
    //do database insert and validation logic
    //return a successful message in the response
    var message = "Customer has been added.";
    return message;
}
```
